

ES Primus SL

Special alloy, soft-annealed

Characteristic or application:

ES Primus SL is suitable for all highly stressed die casting applications such as aluminium, magnesium and other non-ferrous metals such as zinc, tin and lead as well as for tools for hot extrusion presses, forging dies, shear blades and hot steel moulds in general that are subjected to extreme shocks.

ES Primus SL is the right choice, whenever a high resistance to thermal and mechanical cracking is required. This property, combined with a high degree of toughness, translates into a considerably longer service life of moulds and tools.
